A clearer multi-event journey.

Connect public discovery, commitment, attendance review and settlement around one unmistakable event.

PROPOSED / Static document render, not a browser screenshot.

01 **Event context**

Keep the selected event visible through consequential tasks.

02 **Participant status**

Separate payment, admission, attendance and the next action.

03 **Organizer review**

Review source evidence and exceptions before signing.

04 **Money and cases**

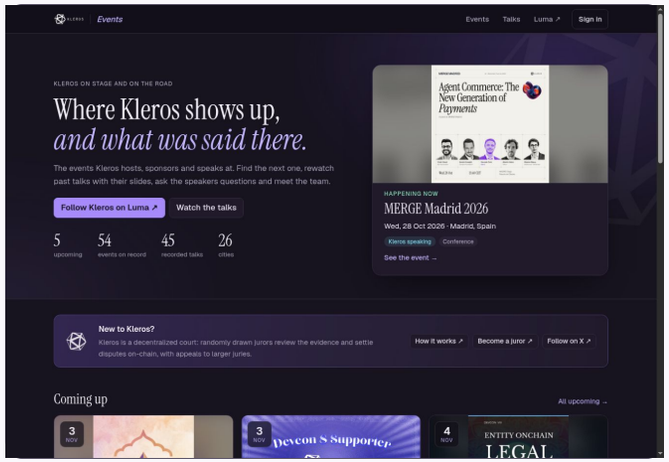

Distinguish transferred, reserved and still-owed funds.

Selected: the prepared B option in all four areas. Continue the current Codex implementation. The earlier project brain remains authoritative for financial behavior.

Three surfaces, different jobs.

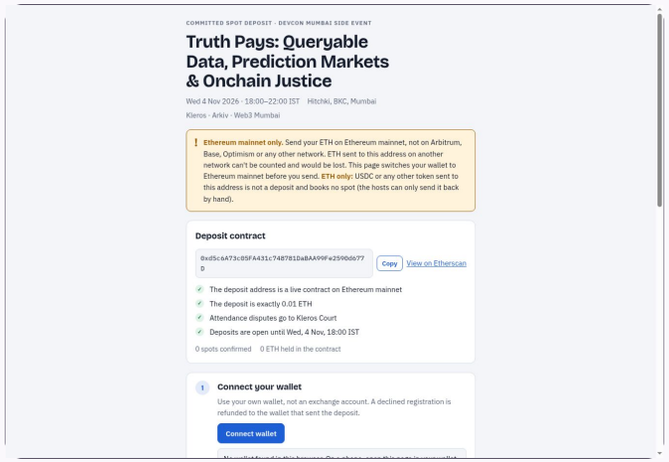

The design unifies the event journey while retaining the useful work already present. [E1, R1-R3]

OBSERVED / Events

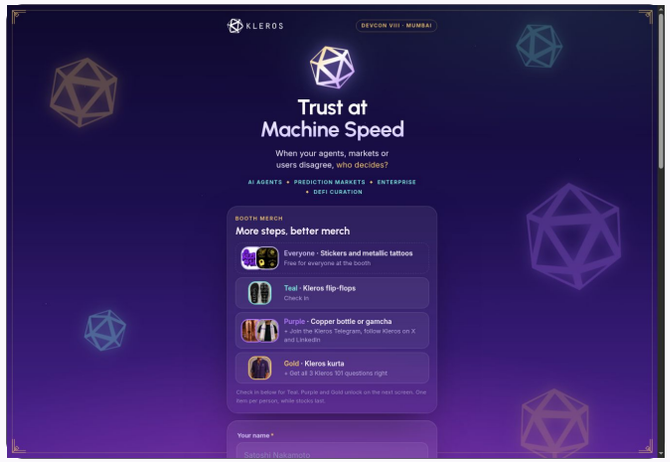

Public discovery and rich event content.

OBSERVED / Kickback

Event-specific deposit and status flow.

OBSERVED / Booth

Lead, consent and merchandise workflow.

Keep what works

Events already has multiple events, content, filters and private access. [R2]

Clarify financial progress

Source phase labels can imply completion while reserved or owed funds remain. [R1]

Add guarded reconciliation

Luma public metadata is not guest-to-wallet or deposit verification. [R1-R2]

Keep authority separate

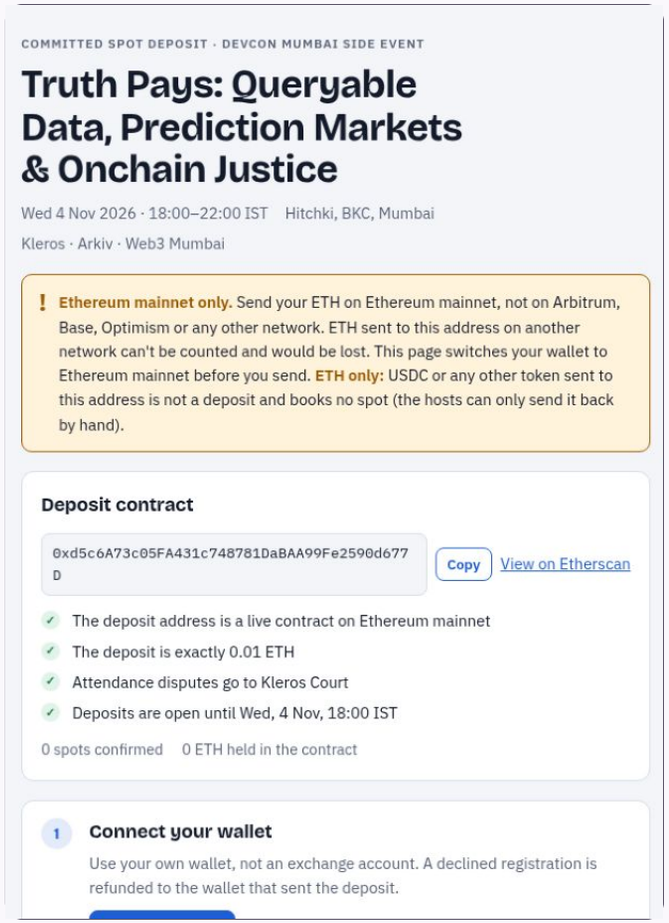

Personal history and booth actions do not establish financial attendance. [R1-R3]

Observed viewport: reported 1363 x 936 CSS px. Saved JPEGs: 1348 x 926 image px. No signed-in or wallet flow was exercised.

Make the next action obvious.

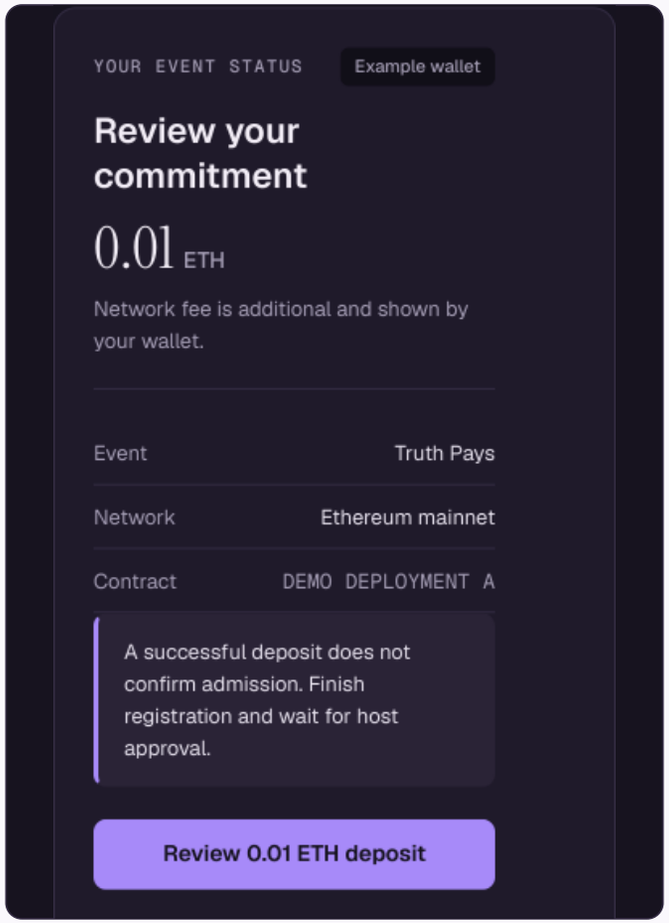

A receipt, host approval, contract registration and attendance are separate facts. [R1-R2]

BEFORE / Observed deposit page

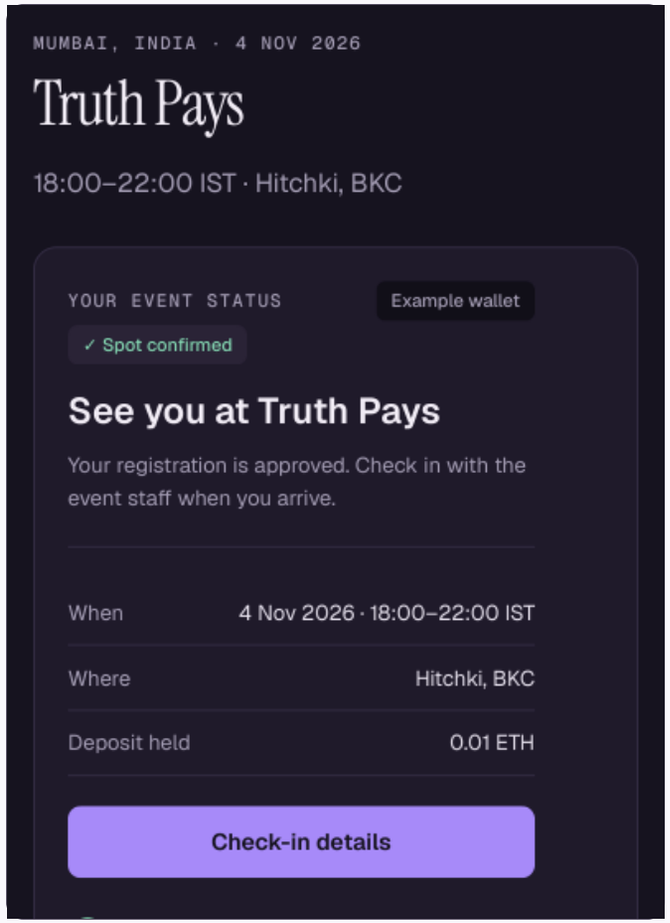

Existing network and deposit safeguards remain.

AFTER / Proposed deposit panel

Show destination, amount and the admission distinction before approval.

AFTER / Proposed mobile status

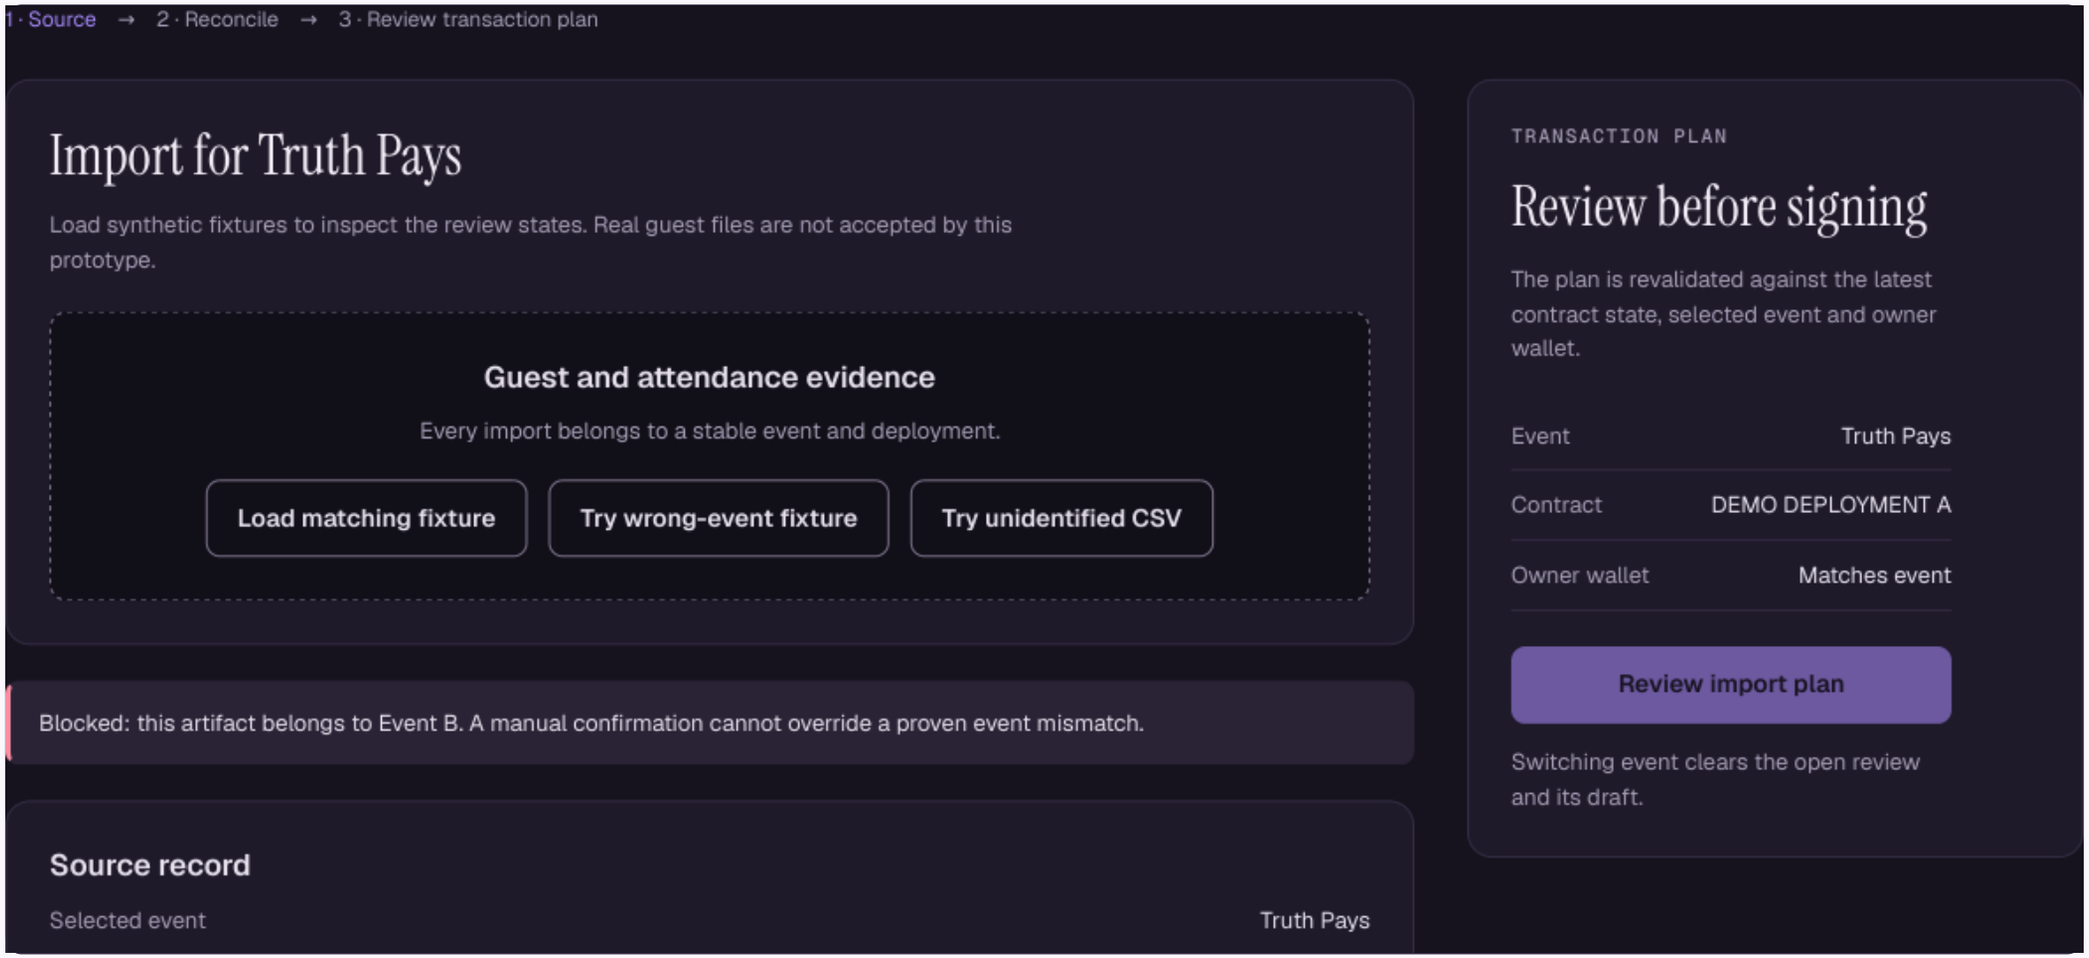

Put status and the next step ahead of supporting event content.

Both proposed panels are static document excerpts. Responsive browser validation remains pending.

Make every import reviewable.

Selected concept: Reconcile inside the event. Proven event mismatches block approval. [R1, E2]

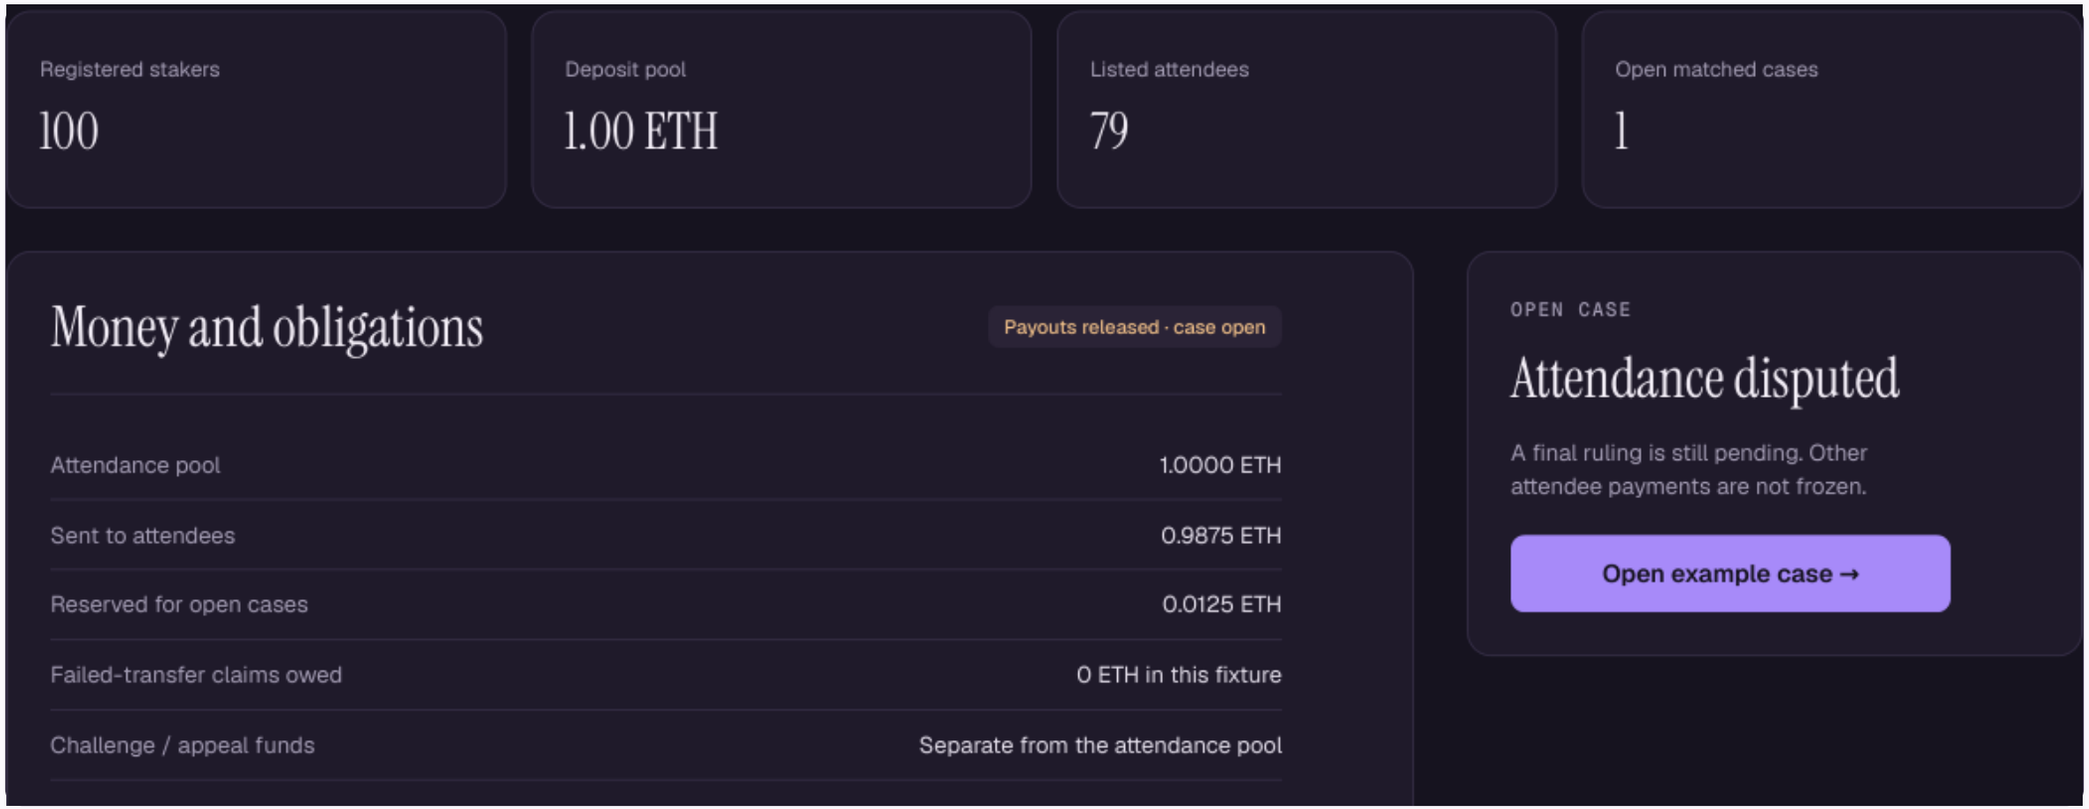

PROPOSED / Static document excerpt with a deliberately wrong-event fixture; approval is disabled.

Implementation: complete the exception table, wallet/deposit matching, exclusions and consequence preview. The prototype demonstrates gates and fixtures; it does not yet implement the full reconciliation table.

Progress is not the same as closure.

Selected concept: An obligations view. Ordinary payouts can proceed while matched cases retain their shares. [R1]

PROPOSED / Static document excerpt. All amounts and participants are synthetic.

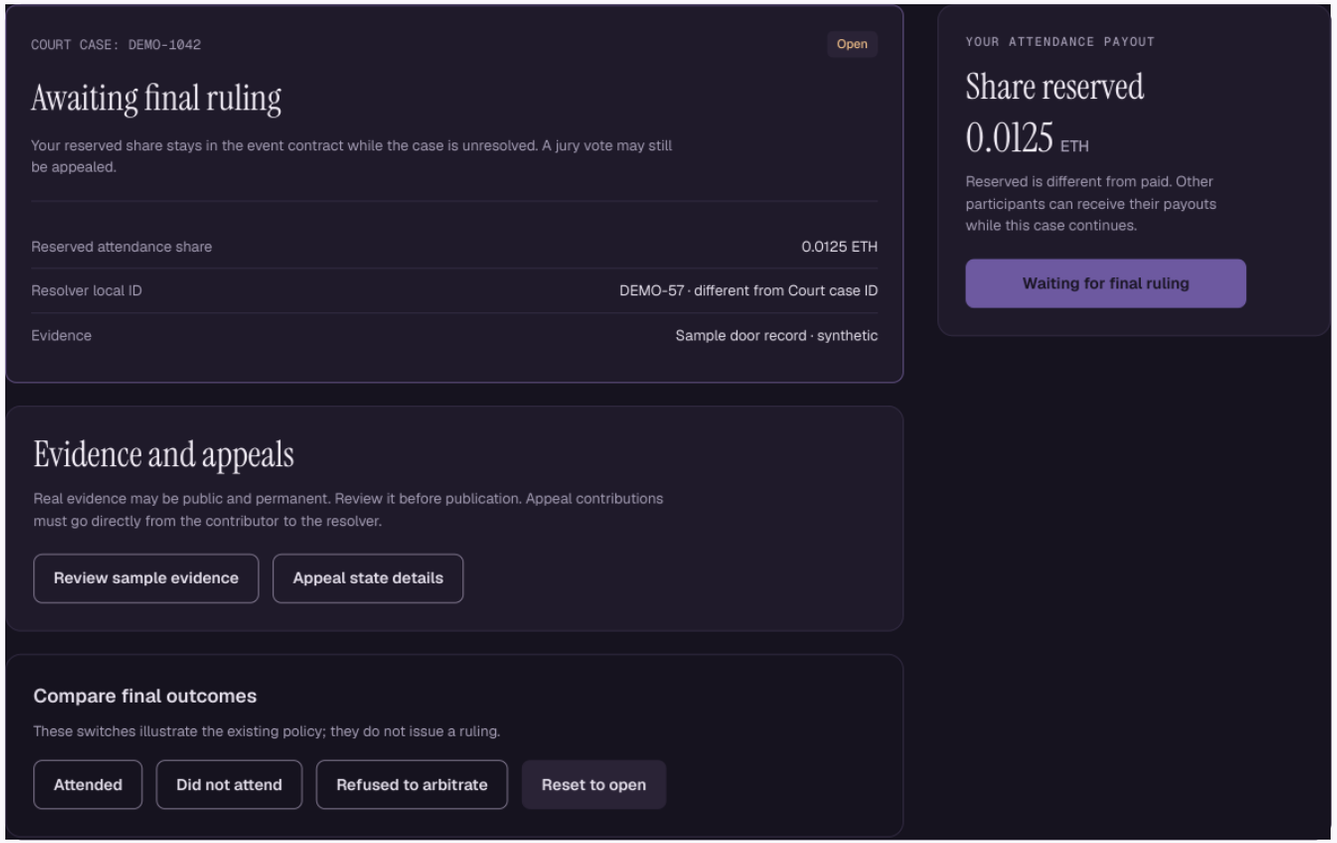

0.9875 ETH
Sent to 79 listed attendees

0.0125 ETH
Reserved for one open matched case

0 ETH
Owed from failed transfers in this fixture

Show what a ruling changes.

The final resolver outcome, settlement and confirmed payment remain separate transitions. [R1]

PROPOSED / Static document excerpt; IDs, evidence and amounts are synthetic.

The offline prototype includes matched, unmatched, appeal, absent, refused, paid and owed states. These are interaction examples, not a Court simulator or production evidence.

Before a match

An unmatched challenge has no created Court case. Its own matching deadline applies.

While a case is open

Show a reserved share and finality status. Other participant payments are not globally frozen.

After a final result

An attended winner receives the held share. Absent/refused attendance outcomes redistribute it.

Keep obligations precise

Ruling 0 challenge-fund treatment is separate from attendance payout. Failed transfers remain owed.

Four choices, with explicit tradeoffs.

Twelve mini-interfaces are provided in DESIGN_OPTIONS.html. The user delegated these selections.

Priority	A / Minimal	B / Selected	C / Bold
Discovery	A clearer directory	An event that stays with you	An editorial event hub
Participant	A more legible sequence	Your state, without ambiguity	A personal event record
Import review	A guided review gate	Reconcile inside the event	An operations workbench
Payouts / cases	Fix the completion language	An obligations view	Parallel settlement tracks

What stays intact

Legacy v7 ETH / Kleros V1 semantics; event-isolated funds and authority; private content; free registration; voluntary consent; original event content and historical links. [R1-R3]

What requires implementation

Real adapters, a complete reconciliation table, independent participant projections, stale-state handling, evidence publication and browser validation. Effort is relative: shell M; participant M/L; imports L; settlement M/L.

Effort labels are design estimates, not time or cost commitments. A justified rebuild remains allowed; preserve current Codex work.

Ready to hand back to Codex.

Attach the complete ZIP to the active task and send CODEX_DESIGN_FOLLOWUP.md. No further design selection is needed.

Completed preparation

49 / 49	DOM-emulator checks passed; zero network attempts.
12 options	Three alternatives for each of four priorities.
17 pairs	Opaque color contrasts calculated at full precision.
7 views	Static proposal excerpts inspected; exact fonts embedded.

Codex must verify

Real browser layouts at 1440 x 900 and 400 x 800; focus and keyboard behavior; overflow and zoom; event switching; real adapter permissions and financial invariants.

The browser script is prepared but unrun. Static document renders and DOM checks are not browser, wallet, smart-contract or production validation.
